

Data Scientist assessment

Plant Rating

Attached is a CSV file with potential plants and characteristics. Assume we are starting a new company and need to prioritize which plants to support.

Your task is to come up with a ranking in which order we should introduce the plants. Look at the traits, make assumptions from a business/customer point of view, and implement a sorting algorithm.

It's up to you to decide which algorithm/model solves the task best.

Any kind of assumptions and weighting is fine, but ensure to document properly so we can follow the reasoning behind your decisions.
